

GroPal Balance (MycorrPlus) Testimonials

By Paul Schneider Jr.,
AG-USA

We are in the process of changing the name of GroPal Balance. The new name is MycorrPlus. GroPal Balance is all about establishing mycorrhizal fungi networks, resulting in many good things, so the name MycorrPlus represents the product well.

Today I would like to share with you a few of the testimonials that our customers have sent in. GroPal Balance (MycorrPlus) is producing wonderful results across the nation!

Jane in Tennessee

“We applied 2 quarts per acre. We see much better growth in our hay fields in the treated areas, and less weed and insect pressure.”

“The leaves are thicker and we see improved growth/yield. We didn’t use any other fertilizer. The soil is looser in the treated fields, with bigger root beds and thicker root systems. There are more earthworms in the treated areas, and less run-off and better drought tolerance.”

Leonard in Florida

“In the fall of 2016 I decided to apply GroPal Balance to 120 acres of newly planted Tiff 9 improved Bahia grass. It was amazing how fast we had grazing in the spring and summer; the grass was knee deep with no additional fertilizer or nitrogen.”

“In 2017 we also sprayed GroPal Balance on an additional 80 acres of newly seeded grass. I have never seen grass germinate as quickly with a great stand. We have never had grazing like we had in 2017 — the cows never caught up.”

Isaac in Indiana

“I applied 64 oz. of GroPal Balance per acre in late spring. I used it on most of my fields, except one spot in the garden where we had peas.”

“Later in the summer when the peas were gone (and it was really dry here then) I tilled the ground where the peas were and didn’t get any moisture; it was dusty and dry.”

“Then I also tilled right beside it, where I had applied GroPal Balance, and there was enough moisture to re-plant. I was amazed at the difference. I

look forward to using it again next year and hopefully I’ll see even better results.”

Harvey in Delaware

“I applied 1 quart per acre. I saw an improvement in growth and yields. We used no other fertility. I pushed a metal rod into the treated area and it easily went down 2 feet. The treated area has more earthworms and less weed and insect pressure.”

John in Texas

“I saw an improvement in plant growth and yields. I didn’t use any other fertility. The treated area was more structured. The root systems were longer in the treated areas, plus there were white fungi strands.”

“The treated soil was more moist than the untreated. We don’t see any fire ants in the treated area; the mounds are dying.”

John in Wisconsin

“I didn’t use GroPal Balance on pasture and hay, but plan on it next year, as we were very pleased with the results on our produce fields.”

“We applied 2 quarts per acre to our vegetables. We also applied chicken compost, sulfur, copper, boron and zinc, since the soil test showed a deficiency of those traces. We also applied Monty’s liquid carbon.”

“I see that the soil is easier to work with. Most of our vegetables we raise for market did really well, even with excess rain at one time, then very dry later.”

“We planted red beets and we really liked what we saw. The root systems had a lot of white fungi on them and the tops were very nice and glossy, even late in the year.”

“When we took up the plastic, I saw more earthworms than ever before. The highlight was the moisture retention. We never irrigated this year, even when others were irrigating.”

“Interestingly enough, I have a corn field right next to my vegetable field, and where the wind carried the spray into my corn field it out-yielded the rest of the field.”

Valentine in Indiana

“I saw improvement in plant growth and yields. More hay from fewer cut-

tings; corn & beans are not harvested yet, but it looks like an excellent crop.”

“I saw some 4-bean pods (4 beans in a pod) in the bean field, which I’ve never seen before, plus improved soil structure and root structure.”

Ryan in Georgia

Ryan: “I will be honest, I thought GroPal Balance was snake oil when I put it out. Well, I had impressive results, and better germination.”

Below are pictures Ryan sent to show us the improvement in germination of his Cosque Black Oats.
