

How to Create Huge Root Structures

By Paul Schneider Jr.,
AG-USA

I recently sent out a letter to our GroPal Balance customers, inviting them to share their results with us.

Most customers mentioned that GPB plants have a larger root structure. Most have also seen that the soil is much looser, more highly structured.

Here is what Phil from Ohio said about his corn:

"I treated 8 rows, left 8 untreated and repeated this pattern across the field. I applied the product as I cultivated the first time by spraying an 8" band over the row and rolling dirt to cover it as I cultivated.

When you sent the letter, I went out and flagged the plots but didn't see anything that jumped out at me. I pulled 4 ears (of corn) out of 1 treated plot that weighed 46.7 oz. total. I pulled 4 ears out of the adjoining untreated plot that weighed 40.8 oz.

total, a difference of 5.9 oz. Calculated at 25,000 plant population that equals 20.57 bushels at \$3.25/bushel, that's \$66.85 benefit from using the product. (This was a \$10 application.)

I pulled 4 ears from the next adjoining plot that was treated ... that equalled a 14.86 bushel increase.

The treated plots had much bigger roots with the brace roots being much more symmetrical and larger in diameter. In fact, there were a good number of plants in the untreated plots that had no brace roots.

I had two farmers that I had talked to that wanted to see the plots. We walked out and viewed them and I asked them to tell me what they saw. Both commented that the treated plots had less weeds than the untreated.

When I talked to you in the spring, I expressed an interest in being a distributor for you. Now that I've seen

what the product can do, I am sure I could move the product, as I'm already working with several organic farmers."

Below is a picture that Phil sent me of his corn roots. GroPal Balance really does help to create huge root mass! Why not give it a try?
